Neuropsychological Deficits Underlying Social Skills Weaknesses and Strategies for Remediation

61st Annual IDA Conference
Phoenix, AZ
Thursday, October 28, 2010
Session T-43
Kevin T. Blake, Ph.D., P.L.C.
Tucson, AZ
C. Wilson Anderson, Jr., M.A.T.
Prior Lake, MN

Kevin T. Blake, Ph.D., P.L.C.

• Licensed Psychologist
  Independent Practice
• Tucson, AZ
• Consulted with:
  – University of Arizona
  SALT & DRC
  – Sierra Tucson

C. Wilson Anderson, Jr., M.A.T.

• Prior Lake, MN
• Former President of the International Dyslexia Association
• President of Educational Consultants of The Midwest, Inc.

Special Thanks

• Angela J. Fawcett, Ph.D.
• Roderick I. Nicolson, Ph.D.
• Drake D. Duane, M.D.
• Bradley C. Duchaine, Ph.D.
• Thomas Grueter, M.D.

Case Study of a Dyslexic

• Male college student
• 21 years old
• 3.8 GPA in Electrical Engineering
• 145 Full Scale IQ
• Excellent social and conversational skills
• Dresses and acts age appropriate
• Mildly depressed (Dx: Dysthmic Disorder)
• Severe Reading Disorder/Dyslexia

Handouts available at:
www.drkevintblake.com
Case Study of a Dyslexic

• "I don't recognize my own face"!
• Developmental Prosopagnosia

What is a Developmental Disorder?

• A disorder characterized by a significant delay in the rate a normal human trait develops in an individual.
• It takes the individual longer to develop this trait than their age peers.

Subtypes of Prosopagnosia

• Possible Associated Conditions:
  – Problems with recognition of facial expression of emotion
  – Problems with gender of face discrimination
  – Problems with age of face discrimination
  – Problems with **TOPOGRAPHAGNOSIA**: difficulty with personal navigation; getting lost easily
  – Asperger’s Disorder

Problems Remembering Faces

– Prosopagnosia: Inability to recognize faces, even one’s own face (p. 1168).
  – Joachim Bodamer, M.D. 1947: German soldiers with brain injuries who could no longer see faces. Coined term “Prosopon” meaning face + “agnosia” meaning nonrecognition from Greek.

Subtypes of Prosopagnosia

• Possible Associated Conditions:
  – Central Auditory Processing Disorder (CAPD): “The inability to understand spoken language in a meaningful way in the absence of what is commonly considered a hearing loss” (Sineps and Hunter, 1997).

Prosopagnosia

• Remembering Faces:
  – This is an important ability for survival.
    • It lets you know “friends and foes”.
    • It helps you maintain relationships.
    • It helps you remember the social status of others.

Kevin T. Blake, Ph.D., P.L.C.
C. Wilson Anderson, Jr., M.A.T.

www.drkevintblake.com

Developmental Prosopagnosia

- Affects 2 to 3 percent of the population
- That equates to 6,000,000 Americans!
- Those affected often know something is wrong, but they don’t know exactly what.

Additional Symptoms of Prosopagnosia Found in Children

- It may take months to recognize their classmates.
- School transition may be a problem.
- Extreme separation anxiety and stranger wariness
- Changes in people’s appearance (i.e., new glasses, new hair style, etc.) may be a problem.
- Feelings of frustration, isolation and embarrassment

Face Perception

- “Our results show that a man with severe prosopagnosia performed normally throughout the standard greeble training procedure. These findings indicate face recognition and greeble recognition rely on separate mechanisms” (Duchaine, et.al., August, 2004).

Symptoms of Prosopagnosia

- Extreme difficulty recognizing faces. Even with a person who is well known by the sufferer (i.e., a parent, spouse, best friend, etc.).
- Appears aloof/arrogant, does not respond to people they “know” when they see them.
- Often complain they cannot follow movies or TV shows because they cannot remember the identity of characters.
- They tend to recognize people by hair, gait, clothing, voice, context, or other information.

Developmental Prosopagnosia

- “The hereditary type of prosopagnosia has an autosomal dominant type of inheritance. This means that men and women are affected in equal numbers. In our experience women are more willing to talk about their face recognition problems, though” (Thomas Grueter, M.D.).

Most people he has evaluated with than late acquired faces while the Face Area. Nicolson said he has stayed away from face recognition Syndrome and LD, AD/HD and NVLD.

“In our sample of about 200 congenital Regarding the above Nicolson stated that he and fellow “There was no overall difference between dyslexics and There is little data regarding the co-...
Dyslexia and Prosopagnosia

• Both Nicolson and Fawcett said, in so many words, that in the above research they were looking for procedural memory/learning deficits in order to develop their procedural memory deficit theory of dyslexia.

Brain Imagery Prosopagnosia and Dyslexia

“The present results emphasize the special nature of the occipitotemporal abnormality to letter strings in dyslexia. However, in behavioral tests dyslexic subjects were slower and more error prone than non-reading impaired subjects in judging the similarity of faces and geometrical shapes. This effect may be due to reduced activation of the right parietotemporal cortex at about 250 ms after onset” (p.1194).

Event Related Potentials, Facial Memory and Dyslexia

“No group differences in amplitude or topography of the old/new effect emerged. However, ERPs for all faces were more positive for normal compared with those of dyslexic readers” (p. 1285).
The researchers further stated that the recognition memory problem dyslexics have is probably specific to verbal stimuli.

How to Assess Developmental Prosopagnosia

• Cambridge Face Memory Test 
• Test My Face Recognition- Internet test

Test My Face Recognition (From web site): www.icn.ud.ac.uk/facetests/

Treatment of Prosopagnosia

• “Prosopagnosics cannot be cured, but they can and do learn ways to recognize people” (p. 70).

**Computer Programs to Treat Prosopagnosia**

- “Let’s Face It!” – Face Recognition Program and workbook for children with Autism Spectrum Disorders (University of Victoria Brain and Cognition Lab & the Yale Child Study Center)
- Teaches facial recognition and emotion recognition in 20 hours!
- It is **FREE!**
  

---

**Mnemonic Techniques to Remember Faces**

- [www.jerrylucas.com](http://www.jerrylucas.com)

---

**Prosopagnosia of Facial Expressions**

“Face perception can be subdivided into two general types – recognition of person identity via the structures of the face, and recognition of internal affective state on the shape of individual features and changes in their relative distance from one another during the expression” (p. 128).

---

**Recognizing Emotional Facial Expressions**

- Emotional Facial Expression Recognition:
  - “Does this mean we come into the world expecting to see human faces and ready to respond with our own prewired facial expressions? Yes!” (Ratey, 2001, p. 300).

---

**Decoding Skill and Facial Expression**

- Positive emotions are the easiest to decode.
- Negative emotions are the most difficult
- Poor interpreters of facial expression have less social acceptance and poorer adjustment.

Decoding Skill and Facial Expression

- Most and Greenbank (2000) stated LD children are less accurate in identifying emotional expressions than non-LD children.
- Brown (2001) indicated AD/HD children are less accurate in facial expression identification than their non-AD/HD peers.
- Attwood (2007) stated those with Asperger's Disorder have great difficulty decoding faces.

Dyslexia and Facial Expressions

- Non-LD children did better than Verbal LD, NVLD and children with both Verbal LD and NVLD in interpreting facial expressions. (Ref. #2)
- Those with Verbal LD did better than those with NVLD. (Non-LD>Verbal LD>NVLD) (Ref. #2)
- Teens (12-15 years) with Verbal LD were worse than those with NVLD, and those who where Non-LD in recognizing facial expressions. (Ref. #3)
- There was no difference between the Non-LD and NVLD groups. (Ref. #3)

FACE READING ASSESSMENT

• Comprehensive Affect Testing System (CATS)
  “This ensemble of tests enables clinical psychologists, neuropsychologists, neurologists, educators, speech therapists and other related disciplines to assess dysfunctional processing of affect expressed by the human face and voice” (p. 1 of 4).

Treating Problems Reading Facial Expressions

• FACIAL EXPRESSIONS CAN BE TAUGHT!

“WILSON, GET READY”!

Computer Programs to Treat Prosopagnosia

  “Harry Potter” teaches facial expressions.

  “Thomas the Tank-Engine” teaches faces.

Computer Programs to Treat Prosopagnosia

• “Gaining Face”: www.ccoder.com/GainingFace

• Paul Ekman, Ph.D. (“Lie to Me”/SPOT – Surveying Passengers by Observational Techniques) CD ROMS:
  Micro Expression Training Tool (METT)
  Subtle Expression Training Tool (SETT)
  Repeated presentations of METT & SETT to those with Autism Spectrum Disorders
  Available from: www.paulekman.com

Treating Problems Making & Reading Facial Expressions

• “Let’s Face It!” – Face Recognition Program and workbook for children with Autism Spectrum Disorders (University of Victoria Brain and Cognition Lab & the Yale Child Study Center)
  Teaches facial recognition and emotion recognition in 20 hours!
  It is FREE!

Teaching Facial Affect Recognition

• Social Skills training by Mental Health Professionals and Speech-Language Pathologists (female teacher with small children)
• 9/11 & Future Prosthetic Devices (Azar, 2000)
• Try an “Emotional Seeing Eye Dog” (Grandin, 1995)

Wearable Prosthetic

“We describe a novel wearable device that perceives and reports on social-emotional information in real-time human interaction. Using a wearable camera, combined with machine perception algorithms, the system records and analyzes the facial expressions and head movements of the person with whom the wearer is interacting. We propose the application of the social-emotional prosthetic to assist the growing number of individuals diagnosed with Autism…”

Wearable Prosthetic

...Spectrum Disorder (ASD) in perceiving communication in a natural rather than a structured environment, bootstrapping their ability to learn and develop in social settings…” (p. 1).

Emotional Seeing Eye Dogs

• Dogs separated from wolves about 135,000 years ago.
• Dogs lived with humans for 100,000 years; even before we were “modern humans” (Homo Habilis).
• Dog and humans co-evolved.
• Humans learned to think and act like dogs.
• Dogs allowed humans to hunt big game while they acted as guards and lookouts. Humans did more planning and organization activities.
• 14,000 years ago humans domesticated dogs.
• Homo Sapien Neantathalensis did not have dogs; they are extinct.
• In the past 100,000 years dogs brains shrank by 10 to 30%; mostly in their forebrains while humans’ brains shrank by 10%; mostly in the midbrain sensory and smell areas.
• Dogs have a symbiotic relationship with humans and have a genetic predisposition to understand human emotions.

HOW TO ACCEPT A COMPLIMENT

• LOOK AT THE PERSON.
• SMILE.
• USE A PLEASANT VOICE TONE.
• SAY, “THANK YOU!”

DATE INTRODUCED __/__/__
DATES ROLE PLAYED SUCCESSFULLY __/__/__
__/__/__
DATE MASTERED __/__/__

www.drkevintblake.com
www.edconsultmidwest.com
HOW TO APOLOGIZE

• LOOK AT THE PERSON.
• USE A QUIET, SINCERE, PLEASANT VOICE
  MAKE A SPECIFIC STATEMENT OF
  APOLOGY.
• STATE A PLAN FOR FUTURE BEHAVIOR.
• ASK THE PERSON TO ACCEPT THE
  APOLOGY.

DATE INTRODUCED __/__/__
DATES ROLE PLAYED SUCCESSFULLY __/__/__ 
__/__/__
DATE MASTERED __/__/__

HOW TO GET THE TEACHER'S ATTENTION

• LOOK AT THE TEACHER.
• RAISE YOUR HAND.
• WAIT FOR THE TEACHER TO CALL ON
  YOU.
• THEN ASK YOUR QUESTION IN A QUIET
  VOICE TONE.

DATE INTRODUCED __/__/__
DATES ROLE PLAYED SUCCESSFULLY __/__/__ 
__/__/__
DATE MASTERED __/__/__

HOW TO ACCEPT CRITICISM OR A CONSEQUENCE

• LOOK AT THE PERSON.
• SAY, "OK."
• NO ARGUING, WHINING OR POUTING.
• IF YOU HAVE A QUESTION, OR YOU NEED
  A REASON, PLEASE WAIT MUCH LATER.

DATE INTRODUCED __/__/__
DATES ROLE PLAYED SUCCESSFULLY __/__/__ 
__/__/__
DATE MASTERED __/__/__

HOW TO ACCEPT "NO" FOR AN ANSWER

• LOOK AT THE PERSON.
• SAY, "OK."
• NO ARGUING, WHINING, OR POUTING.
• IF YOU DON'T UNDERSTAND WHY, CALMLY
  ASK FOR A REASON.
• IF YOU DISAGREE, BRING IT UP MUCH
  LATER.

DATE INTRODUCED __/__/__
DATES ROLE PLAYED SUCCESSFULLY __/__/__ 
__/__/__
DATE MASTERED __/__/__

HOW TO SAY "NO!"

• LOOK AT THE PERSON.
• SAY, "NO, I CAN'T DO THAT BECAUSE......"
• (IT CAN HURT SOMEONE, IT WILL GET ME IN
  TROUBLE, I DON'T THINK IT IS FAIR, IF I LIE FOR
  YOU, WHAT'S TO STOP ME FROM LYING TO YOU?)
• IF NECESSARY, WALK AWAY AND SAY, "SEE YA
  LATER."

DATE INTRODUCED __/__/__
DATES ROLE PLAYED SUCCESSFULLY __/__/__ 
__/__/__
DATE MASTERED __/__/__

Thanks! Have Fun in Arizona
and a Safe Trip Home!
AD/HD and Facial Expressions

"Children with ADHD exhibited a general deficit in decoding emotional facial expressions, with specific deficit in identifying anger and sadness. Self-rating of the task difficulty revealed lack of awareness of decoding errors in the ADHD group as compared with control subjects. Within the ADHD group, there was a significant correlation between interpersonal problems and emotional facial expression decoding impairment, which was more marked for anger expressions" (p. 93).

AD/HD and Facial Expressions

“Attention deficits in boys with ADHD seemed to account for their difficulty in recognizing facial expressions of emotion. Effective treatment for attention deficits is expected to have a beneficial effect on facial emotion recognition in boys with ADHD". (p. 323)

Research evidence indicates that emotional facial recognition difficulties in people with ADHD may be related to biological impairment of the medial prefrontal cortex and amygdala.

AD/HD and Facial Expressions

- “These results suggest that affect recognition abilities may be impaired in adults with ADHD and affect abilities are more adversely affected by inattentive than hyperactive-impulsive symptoms” (p. 1)
- No difference between non-disabled and those with Combined Type AD/HD in facial expression recognition.
- Those with Inattentive AD/HD made more errors in recognizing expressions of fear.

Possible Treatment for Emotional Working Memory Problems

- Stimulant Medication?
  - Lessens Hyperactivity and Impulsivity in AD/HD, Combined Type Individuals
  - Hundreds of Double Blind Studies to Support

Prosopagnosia and NVLD (Nonverbal Learning Disorders)

“Hence, it appears that children with NLD have a specific deficit on immediate memory for faces. This facial memory deficit may be linked to a deficit in right hemisphere functioning which has already been implicated in facial processing and may also be linked with other disorders (e.g., autism spectrum disorder) in which similar facial processing deficits have been documented.” (p. 1-2)

AD/HD and Facial Expressions

Research indicates there may be altered neurological functioning of identifying affect anger and fear recognition in those with AD/HD that appear to be reduced by methylphenidate (Ritalin). Those with ADHD had left amygdala overactivation when viewing neutral faces.

Possible Alternative Medicine Treatment for Working Memory Problems in AD/HD

- Working Memory Training:
  - Torkel Klingberg, M.D., Ph.D.
  - Karolinska Institute- Stockholm, Sweden
  - CogMed software company (RM Program)
  - AD/HD deficient in visual spatial working memory (WM). Gets worse with age.
  - MAY help relieve visual spatial WM difficulties and reading comprehension in Combined Type AD/HD.
  - More Research is needed!

Prosopagnosia and Autism Spectrum Disorders

“Although not part of current diagnostic criteria, much evidence suggests that persons with ASD have marked deficits in face perception.” (p. 127)

Face Perception in ASD

- The Fusiform Face Area (FFA) responds much more to faces than to other objects.
- Nine different labs have found that those with Autism Spectrum Disorders have a hypoactivation of the FFA when viewing faces.
- Developmental Prosopagnosia and Developmental Agnosia are separate disorders.

Facial Expressions

- Remembering Expressions:
  - The non-disabled are “pre-wired” to find the human face and voice the most important stimuli in the world.
  - Those with Asperger’s Disorder (AD) don’t look at the eyes they look at the mouth. Differentiated those with AD from non-disabled 100% of the time.

Facial Expression Training & Autism

- “Even when people with autism spectrum disorders can figure out what someone’s eyes or face conveys, they do so in a different way than everyone else, which may be less efficient or take more time” (p. 62).
- The non-disabled use the temporal lobe and fusiform gyrus to decode facial expressions.

Prosopagnosia and Autism Spectrum Disorders

“Thus, these data argue for the role of the FFA-amygdala system in social cognition more generally, and retrieval of specific social knowledge about what constitutes a friendly social interaction, or not. Collectively these data suggest the the amygdala-FFA system and its failure to strongly activate during face perception tasks points to a causal mechanism involved in autism…” (p. 137).

Facial Expression Training & Autism

- Looking at pictures of eyes and deciphering the emotion they conveyed activated the non-disabled amygdalas and frontal lobes.
- Those with Asperger’s used the frontal lobes far less and did not activate the amygdala. They used other areas of the brain not designed for such tasks.
- Those with Asperger’s may use voice, touch, etc. to recognize others, not their face.

Possible Future Treatment for Facial Recognition, Etc. with Autism Spectrum Disorders

- “Thus, under oxytocin, patients respond more strongly to others and exhibit more appropriate social behavior and affect, suggesting a therapeutic potential of oxytocin through its action on a core dimension of autism”. (p. 4389)
- “With increased oxytocin levels, previously presented faces were more correctly assessed as “known,” whereas the ability of recollecting faces was unchanged” . (p. 38)
- Internasal oxytocin improves emotional facial expression recognition in those with Autism Spectrum Disorders.
- The use of Risperidone has been approved with those who have Autism Spectrum Disorders because it can increase oxytocin.

References for Slide #72

Kevin T. Blake, Ph.D., P.L.C.

AD/HD and Making Facial Expressions

• Regarding facial expressions in children and adults with AD/HD Kuhle, Hoch, Rautzenberg and Jansen (2001) concluded, “Altogether, … the facial expressions, are uncontrolled and jerky and are often wrongly dimensioned in time and space.” (p. 6)

Kevin T. Blake, Ph.D., P.L.C.

Facial Expressions and AD/HD

• AD/HD children smile abruptly.
• There is little or no transition between emotional states.
• Sometimes their facial expression bleeds over into the next emotional state.
• Expression of emotion often appears exaggerated. The quality of expression can be limited due to this.
• Even body movements are jerky and uncontrolled.

Kevin T. Blake, Ph.D., P.L.C.

Possible Treatment of Problems with Facial Expression and AD/HD

• Optimal dosing of a stimulant medication causes a significant reduction in visual attention loss.
• Facial expressions will become smooth and variable.
• Too high a dose can cause a return of the symptoms.
• Can properly ID 80% of the AD/HD children with video procedure.

Kevin T. Blake, Ph.D., P.L.C.
Famous People with Prosopagnosia
